1. INTRODUCTION 1
   1.1 Classification of Nonlinear Integer Programming Formulations 2
   1.2 Examples of Applications 4
      1.2.1 Resource allocation in production planning 4
      1.2.2 Portfolio selection 4
      1.2.3 Redundancy optimization in reliability networks 6
      1.2.4 Chemical engineering 7
   1.3 Difficulties and Challenges 8
   1.4 Organization of the Book 10
   1.5 Notes 11

2. OPTIMALITY, RELAXATION AND GENERAL SOLUTION PROCEDURES 13
   2.1 Optimality Condition via Bounds 14
   2.2 Partial Enumeration 14
      2.2.1 Outline of the general branch-and-bound method 15
      2.2.2 The back-track scheme 17
   2.3 Continuous Relaxation and Lagrangian Relaxation 24
      2.3.1 Continuous relaxation 24
      2.3.2 Lagrangian relaxation 25

2.3.3 Continuous bound versus Lagrangian bound 26
2.4 Proximity between Continuous Solution and Integer Solution 28
2.4.1 Linear integer program 29
2.4.2 Linearly constrained separable convex integer program 31
2.4.3 Unconstrained convex integer program 32
2.5 Penalty Function Approach 37
2.6 Optimality Conditions for Unconstrained Binary Quadratic Problems 38
2.6.1 General case 38
2.6.2 Convex case 42
2.7 Notes 44
3. LAGRANGIAN DUALITY THEORY 45
3.1 Lagrangian Relaxation and Dual Formulation 45
3.2 Dual Search Methods 52
3.2.1 Subgradient method 52
3.2.2 Outer Lagrangian linearization method 57
3.2.3 Bundle method 68
3.3 Perturbation Function 70
3.4 Optimal Generating Multiplier and Optimal Primal-Dual Pair 77
3.5 Solution Properties of the Dual Problem 83
3.6 Lagrangian Decomposition via Copying Constraints 88
3.6.1 General Lagrangian decomposition schemes 88
3.6.2 0-1 quadratic case 91
3.7 Notes 95
4. SURROGATE DUALITY THEORY 97
4.1 Conventional Surrogate Dual Method 97
4.1.1 Surrogate dual and its properties 97
4.1.2 Surrogate dual search 99
4.2 Nonlinear Surrogate Dual Method 104
4.3 Notes 112
5. NONLINEAR LAGRANGIAN AND STRONG DUALITY 113
5.1 Convexification and Nonlinear Support: p-th power Nonlinear Lagrangian Formulation 113
5.2 Nonlinear Lagrangian Theory Using Equivalent Reformulation 118
5.3 Nonlinear Lagrangian Theory Using Logarithmic-Exponential Dual Formulation 127

5.4 Generalized Nonlinear Lagrangian Theory for Singly-Constrained Nonlinear Integer Programming Problems 137
5.5 Notes 148

6. NONLINEAR KNAPSACK PROBLEMS 149
6.1 Continuous-Relaxation-Based Branch-and-Bound Methods 150
6.1.1 Multiplier search method 151
6.1.2 Pegging method 157
6.2 0-1 Linearization Method 159
6.2.1 0-1 linearization 159
6.2.2 Algorithms for 0-1 linear knapsack problem 161
6.3 Convergent Lagrangian and Domain Cut Algorithm 164
6.3.1 Derivation of the algorithm 165
6.3.2 Domain cut 170
6.3.3 The main algorithm 173
6.3.4 Multi-dimensional nonlinear knapsack problems 176
6.4 Concave Nonlinear Knapsack Problems 181
6.4.1 Linear approximation 181
6.4.2 Domain cut and linear approximation method 184
6.5 Reliability Optimization in Series-Parallel Reliability Networks 188
6.5.1 Maximal decreasing property 190
6.6 Implementation and Computational Results 195
6.6.1 Test problems 196
6.6.2 Heuristics for feasible solutions 198
6.6.3 Numerical results of Algorithm 6.2 for singly constrained cases 199
6.6.4 Numerical results of Algorithm 6.2 for multiply constrained cases 201
6.6.5 Numerical results of Algorithm 6.3 202
6.6.6 Comparison results 203
6.7 Notes 206

7. SEPARABLE INTEGER PROGRAMMING 209
7.1 Dynamic Programming Method 209
7.1.1 Backward dynamic programming 210
7.1.2 Forward dynamic programming 211
7.1.3 Singly constrained case 215
7.2 Hybrid Method 217

7.2.1 Dynamic programming procedure 218
7.2.2 Incorporation of elimination procedure 219
7.2.3 Relaxation of (RSP_k) 221
7.3 Convergent Lagrangian and Objective Level Cut Method 224
7.3.1 Motivation 224
7.3.2 Algorithm description 227
7.3.3 Implementation of dynamic programming 233
7.3.4 Computational experiment 236
7.4 Notes 238

8. NONLINEAR INTEGER PROGRAMMING WITH A QUADRATIC OBJECTIVE FUNCTION 241
8.1 Quadratic Contour Cut 241
8.1.1 Ellipse of quadratic contour 242
8.1.2 Contour cuts of quadratic function 243
8.2 Convergent Lagrangian and Objective Contour Cut Method 245
8.3 Extension to Problems with Multiple Constraints 250
8.4 Extension to Problems with Indefinite q 254
8.5 Computational Results 257
8.5.1 Test problems 258
8.5.2 Computational results 260
8.5.3 Comparison with other methods 262
8.6 Note 264

9. NONSEPARABLE INTEGER PROGRAMMING 265
9.1 Branch-and-Bound Method based on Continuous Relaxation 265
9.1.1 Branching variables 267
9.1.2 Branching nodes 268
9.2 Lagrangian Decomposition Method 268
9.3 Monotone Integer Programming 272
9.3.1 Discrete polyblock method for (MIP) 273
9.3.2 Convexity and monotonicity 277
9.3.3 Equivalent transformation using convexification 281
9.3.4 Polyblock and convexification method for (MIP) 284
9.3.5 Computational results 286
9.4 Notes 290

10. UNCONSTRAINED POLYNOMIAL 0-1 OPTIMIZATION 293
10.1 Roof Duality 293
10.1.1 Basic concepts 294
10.1.2 Relation to other linearization formulations 297
10.1.3 Quadratic case 299
10.2 Local Search 300
10.3 Basic Algorithm 301
10.4 Continuous Relaxation and its Convexification 304
10.5 Unconstrained Quadratic 0-1 Optimization 306
10.5.1 A polynomially solvable case 307
10.5.2 Equivalence to maximum-cut problem 308
10.5.3 Variable fixation 309
10.6 Notes 313

11. CONSTRAINED POLYNOMIAL 0-1 PROGRAMMING 315
11.1 Reduction to Unconstrained Problem 315
11.2 Linearization Methods 317
11.3 Branch-and-Bound Method 319
11.3.1 Upper bounds and penalties 319
11.3.2 Branch-and-bound method 320
11.4 Cutting Plane Methods 321
11.4.1 Generalized covering relaxation 321
11.4.2 Lower bounding linear function 324
11.4.3 Linearization of polynomial inequality 326
11.5 Quadratic 0-1 Knapsack Problems 328
11.5.1 Lagrangian dual of (QKP) 328
11.5.2 Heuristics for finding feasible solutions 335
11.5.3 Branch-and-bound method 339
11.5.4 Alternative upper bounds 341
11.6 Notes 348

12. TWO LEVEL METHODS FOR CONSTRAINED POLYNOMIAL 0-1 PROGRAMMING 349
12.1 Revised Taha's Method 349
12.1.1 Definitions and notations 350
12.1.2 Fathoming, consistency and augmentation 352
12.1.3 Solution algorithm 357

12.2 Two-Level Method for p-Norm Surrogate Constraint Formulation 360
12.3 Convergent Lagrangian Method Using Objective Level Cut 368
12.4 Computational Results 370
12.5 Notes 371

13. MIXED-INTEGER NONLINEAR PROGRAMMING 373
13.1 Introduction 373
13.2 Branch-and-Bound Method 375
13.3 Generalized Benders Decomposition 377
13.4 Outer Approximation Method 382
13.5 Nonconvex Mixed-Integer Programming 389
13.5.1 Convex relaxation 390
13.5.2 Convexification method 393
13.6 Notes 394

14. GLOBAL DESCENT METHODS 397
14.1 Local Search and Global Descent 398
14.1.1 Local minima and local search 398
14.1.2 Identification of global minimum from among local minima 400
14.2 A Class of Discrete Global Descent Functions 400
14.2.1 Condition (D1) 403
14.2.2 Condition (D2) 403
14.2.3 Condition (D3) 405
14.3 The Discrete Global Descent Method 410
14.4 Computational Results 412
14.5 Notes 416
